

Statement by Dr. W. Norek after several years of experience with beautytek

As a certified physician for anti aging, member of GSAAM (German Society of Anti-Aging Medicine) and gynaecologist I was looking for a revolutionary, successful but still not invasive method for the lifting of tissue and fat reduction, which at the same time does not include any risk.

After extensive investigations, I came across the beautytek treatment. During an international symposium and right from the beginning it convinced me of its effectiveness. After further examination and numerous trainings, but particularly today, after hundreds of treatments, my first impression got confirmed and verified. beautytek provides wonderful, long-lasting results - in a simple way, without pain or any risk.

This gentle and bloodless treatment is applicable for both, men and women of any age, especially if they want to prevent an operation. beautytek offers long-term reduction of fat and effective tightening of tissue - particularly in areas where it is very difficult to reduce the fat volume with a diet or by exercising.

How does beautytek work?

This innovative system is based on a special bio-cybernetic process, which results in an energetic balance in the respective area. Within a control-loop system the unit recognizes energetic deficiencies, which are then being treated accurately by complex computer algorithms.

The treatment with beautytek is a pleasant method without any pain or risk for the body. Your specialist uses a probe and a special electrolytic gel when stroking across the respective area. This causes an energetic balance in selected areas of the body - similar to the acupuncture points - which activates and accelerates the self-repairing power of the body. The bio-cybernetic control-loop system prevents any overdose or underdose.

The actions of every treatment unit are adjusted to the area of the body and the individual conditions. Your specialist follows the progress during the treatment while beautytek defines the body reactions and reacts accordingly. One treatment unit takes approximately 30 - 90 minutes, depending on the chosen form of treatment and the desired result. Our experience shows that a cycle of about eight treatment units provides an optimum and long-lasting effect.
